Towards a Digital Twin for Ocean Health

What is a Digital Twin?

“A digital twin is a **virtual replica** that serves as the **real-time digital representation** of a **physical object or process**”.

“Digital twins are the result of **continual improvement** in the creation of **product design** and **engineering activities**”.

source: Wikipedia.

What are the elements of a DT?

- **Smart Sensors** for **RT data** collection
- Systems for data transfer and **data feeds**
- Decentralized or centrally-stored in **cloud**
- High resolution/high in accuracy **simulations** to virtual copies
- Interactive **platforms** to display RT 3D/4D spatial-temporal data
- Integrating **IoT, AI** and software analytics
- Augmented reality (AR) systems as **visualization** technologies
- **Optimize** machines, products, processes, services
- Monitoring, diagnostics, **prognostics**

Where DTs are used?

- Manufacturing
- Automotive
- Construction
- Utilities
- Healthcare

DIGITAL TWINS IN ILIAD

Iliad's Digital Twin of the Ocean provides a **virtual environment representing the ocean, capable of running complex, predictive management scenarios**. The innovative system integrates cross discipline sensors, models and digital infrastructures.

ILIAD IN A SEASHELL

Enabling an ecosystem of **interoperable digital twins** for the ocean trough:

- Connecting to existing ocean data infrastructures
- Enhance ocean data infrastructures with additional **observation technologies** and **citizen science**

Create an open **marketplace** accessible for all providers and users by:

- Development of **innovative methods** in open frameworks and platforms
- Enable model **evaluations & comparisons** for many Earth science applications from weather, energy, aquaculture to climate and more

Provide **solutions** to address future societal challenges by:

- Assembling a broad and diverse **user community** of existing and new users,
- Supporting the communities in testing and using the project's **innovative technological solutions**

Forecasting Numerical Models with Data Assimilation

Sensors at Sea – RT Data Transfer to DUTH Server

- **4 ADCPs** for 3D currents, waves and SPM monitoring
- **1 surface water quality station** (SST, S, DO, Chl, pH, SPM)
- **2 Wave riders** (wave height, period and direction)
- **Glider surveys** (T, C, S, σ_t , CDOM, SPM, DO)

Instrumentation Deployed in Thracian Sea

4 oceanographic stations deployed in Kariani, Palio, Perigiali and Avdira, collecting and transferring RT oceanographic data on

- a) **waves**
(significant wave height, wave period and wave direction),
- b) **currents**
throughout the water column,
- c) **water quality**
(temperature, salinity, dissolved oxygen, SPM).

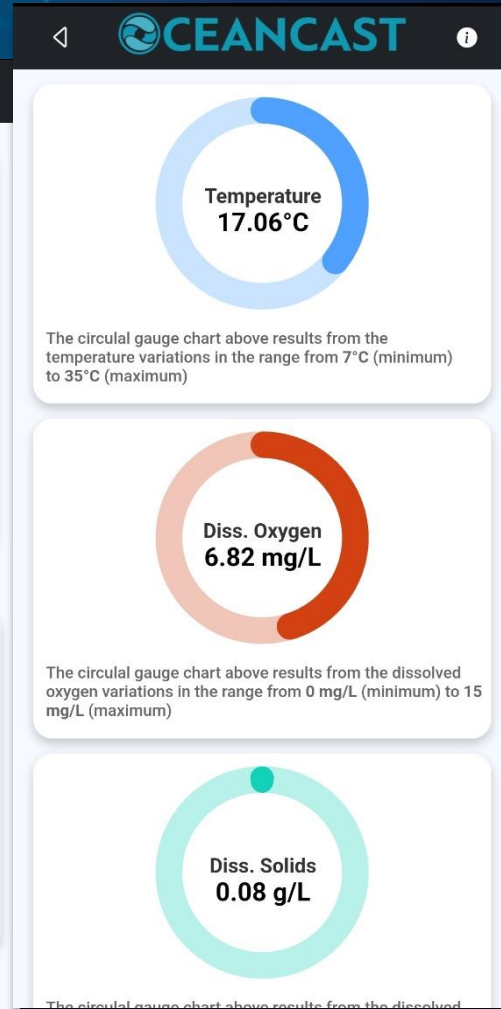

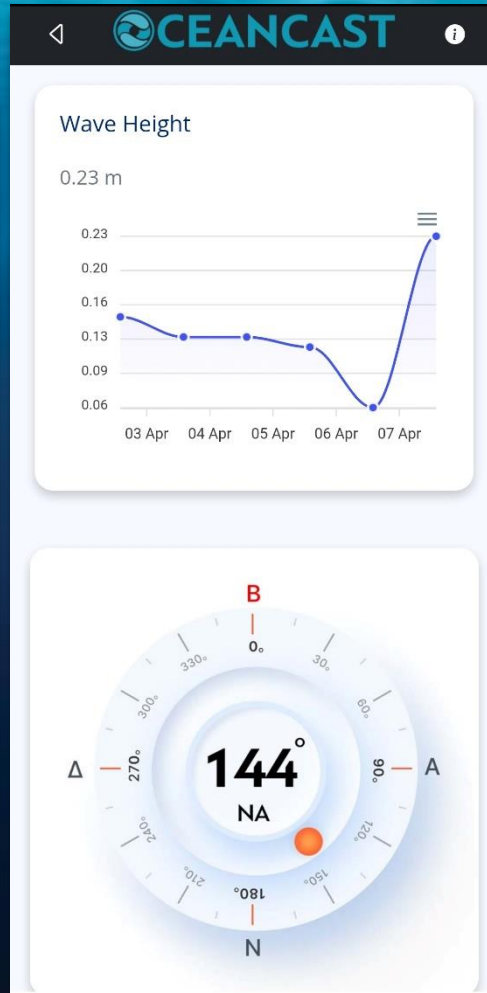

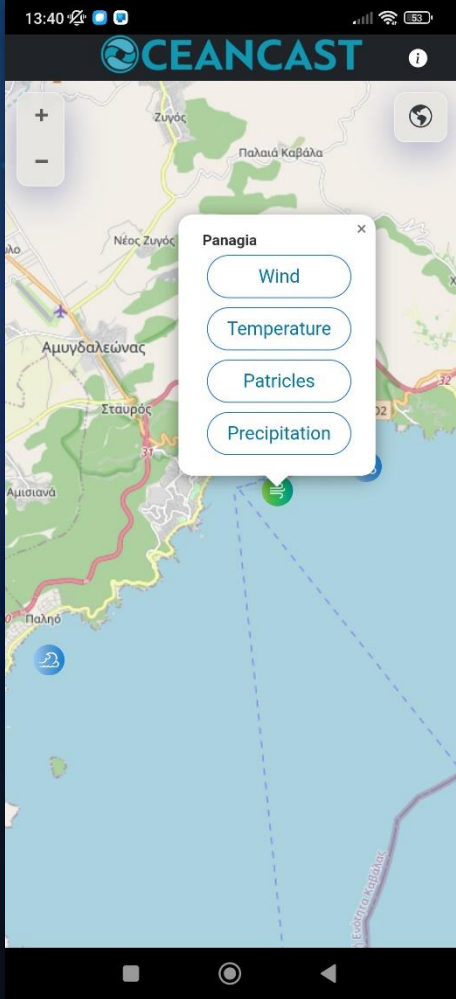

Coastal Atmospheric Conditions

- 1** meteorological station installed in Kavala coastal zone for the RT measurements:
- a) air temperature, wind speed and direction, barometric pressure, relative humidity, dew point temperature, precipitation,
 - b) air quality (PM10 concentration).

Mobile Oceancast App

Glider Surveys in Thracian Sea – summer 2023

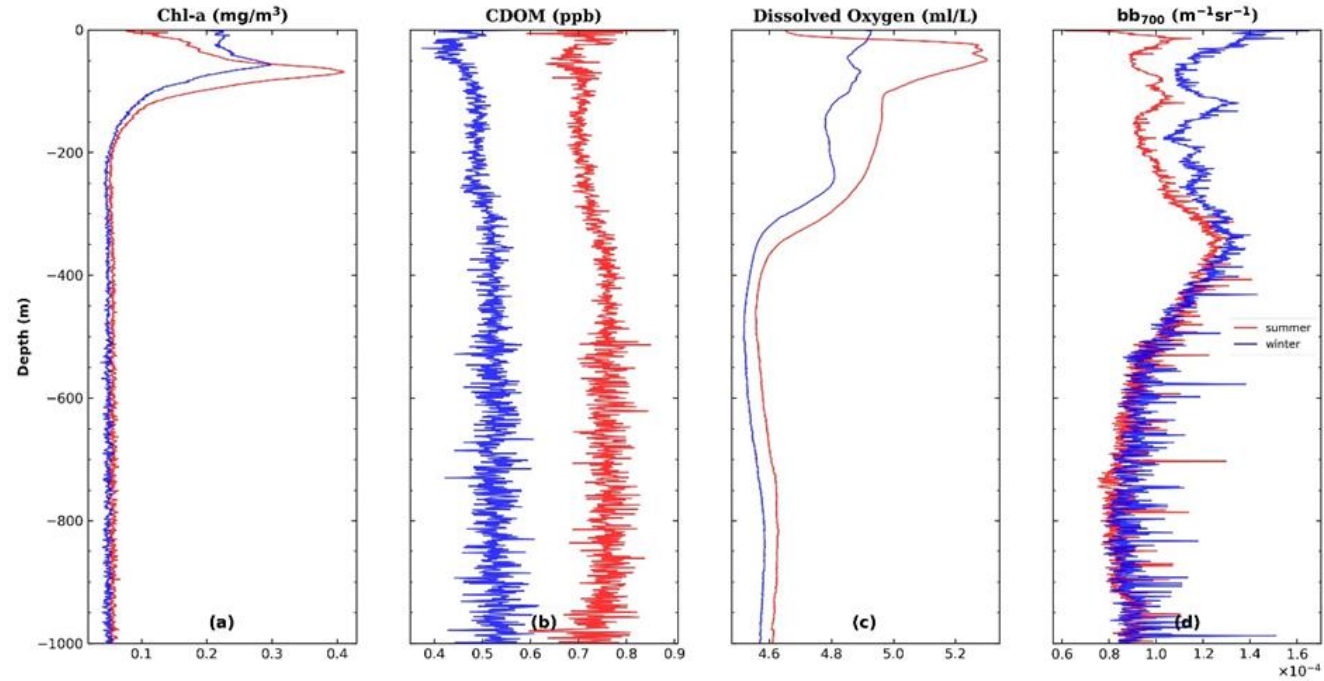

Glider equipped with sensor payload consisting of:

- CTD sensor
- CDOM, SPM, Chl-a
- ADCP
- Plankton UPV6 Camera

The Thracian Sea Digital Twin Architecture

An aerial photograph of a white boat moving across clear, turquoise water. The water's clarity reveals a rocky seabed with various shades of brown and green. The boat is positioned in the upper left quadrant, leaving a white wake behind it. The overall scene is vibrant and scenic.

THANK YOU!
